BEGINNER — INTERMEDIATE

WHAT IS THE OPENING RANGE BREAKOUT?

The Opening Range Breakout — or ORB — is one of the **highest probability setups in day trading**. The concept is simple: the market defines a range in the first 15 minutes of the session, and the breakout of that range tells you where price wants to go for the rest of the day.

The first 15 minutes of the New York session (9:30–9:45 AM EST) are the most volatile minutes of the trading day. Institutions are filling orders, retail traders are reacting, and price is establishing the **opening range high (ORH)** and **opening range low (ORL)**. Once that range is set — we wait.

The Core Idea: When price breaks above the ORH, it signals bullish momentum — we look to buy. When price breaks below the ORL, it signals bearish momentum — we look to sell. The ORB is your daily roadmap.

WHY IT WORKS

Institutional order flow drives the opening session. The ORB captures the moment institutions commit to direction — giving retail traders a high-probability signal to follow smart money.

THE 15-MINUTE CANDLE

We use the first 15-minute candle to define the range. The high of that candle = ORH. The low = ORL. Mark both levels before the market opens and watch them all session.

"The market tells you the story every day. The ORB is the first chapter."

THE 4 ENTRY MODELS AT A GLANCE

Not every breakout is the same. Not every session plays out clean. That's why you need **four different tools in your belt** — so no matter how the market moves, you have a defined playbook to follow.

#	ENTRY MODEL	RISK LEVEL	BEST USED WHEN
01	Straight Break	Very High	Strong momentum candle, high volume — use sparingly
02	Break & Retest	Low– Medium	Price breaks, pulls back to ORB level, rejects — highest probability
03	Liquidity Sweep	Medium	Price sweeps a session high/low before reversing in your direction
04	Rejection Inside ORB	Medium	Fake breakout of one side — fade it and target the opposite ORB level

Key Rule: You don't need to trade all four entries every day. Identify which setup the market is giving you and execute it with discipline. One good trade beats four forced trades every time.

WHAT YOU NEED PRE-MARKET

- ✓ Previous session high & low marked
- ✓ New Week Opening Gap noted
- ✓ Key fair value gaps on 5m & 15m
- ✓ Overall market bias (bullish or bearish)

WHAT YOU'RE WATCHING AT OPEN

- ✓ First 15-minute candle forming
- ✓ Volume on the breakout candle
- ✓ Where price is relative to liquidity
- ✓ Which ORB entry model is setting up

"Patience is the edge. The market always gives you a second chance to enter — if you're disciplined enough to wait for it."

THE STRAIGHT BREAK ENTRY

● ● ● ● ● VERY HIGH RISK

Enter the moment price breaks the ORB level — no retest, no confirmation. The most aggressive, highest-risk entry. Use rarely and **only when momentum is undeniable**.

- 1 **Wait for the 15-minute candle to close**
The ORB is defined by the close of the first 15-min candle. Mark the high and low as your ORH and ORL.
- 2 **Look for a full-bodied, high-volume breakout candle**
A valid straight break is a strong, decisive candle blowing through the level — not a wick, not a slow grind. You want to see conviction.
- 3 **Enter at market on the breakout candle or next open**
If you miss the first candle, wait for the next candle open. Don't chase it more than one candle — the edge is gone.
- 4 **Stop just below the ORB level — target the next liquidity zone**
If price returns back inside the ORB, the setup is invalidated. Keep risk tight. Target the previous session high/low or key fair value gap.

Warning: This entry gets new traders in trouble. The market frequently fakes breakouts. If you're not yet experienced reading momentum and volume, skip this entry until you are.

THE BREAK & RETEST ENTRY

● ● ● ● ● LOW-MEDIUM RISK · BEST ENTRY

This is **the money entry**. Instead of chasing the breakout, you wait for price to confirm the level, pull back, and give you a clean, lower-risk entry with a tighter stop and more conviction.

- 1 Wait for price to break the ORB level**
Let price break the ORH (bullish) or ORL (bearish). You're not entering here — just watching and confirming the break is real.
- 2 Wait for the pullback — price comes back to the ORB level**
Price breaks out and pulls back to the level it just broke. Institutions are re-accumulating before the next leg. You want to see this happen.
- 3 Wait for rejection at the level — then enter**
The critical step. Price retests the level and rejects it. On a bullish setup, the ORH now acts as support. That rejection is your entry trigger.
- 4 Stop just beyond the retest — target the next liquidity level**
Tighter stop, more conviction. You can hold for bigger targets — previous session high/low, new week opening gap, or the next key fair value gap.

Pro Tip: Pair the retest with a 1-min or 5-min fair value gap at the ORB level for even higher conviction. FVG + ORB retest at the same level is one of the strongest confluences in the playbook.

THE LIQUIDITY SWEEP ENTRY

● ● ● ● ● MEDIUM RISK

Institutions **hunt liquidity**. Pools of stop losses sit above previous session highs and below previous session lows. Smart money sweeps those stops, grabs the liquidity they need, then reverses. **That reversal is your entry.**

- 1 **Mark the key liquidity level pre-market**
Previous session high/low, previous day high/low, obvious swing highs/lows on the 15-min chart. These are your liquidity targets.
- 2 **Watch for price to spike aggressively through the level**
Price wicks through the key level — taking out stop losses. This is the "sweep." It happens fast, usually in 1–3 candles.
- 3 **Wait for the reversal candle — that's your signal**
After the sweep, a strong reversal candle closes back on the correct side of the level. That candle is your entry trigger.
- 4 **Enter on the reversal — stop beyond the sweep extreme**
Stop goes just beyond the extreme of the wick. If price continues past that point, the thesis is wrong. Target the opposite ORB level or next liquidity zone.

Remember: The sweep itself is not the entry — the **rejection of the sweep** is. Chasing the sweep is how you get trapped on the wrong side of the move.

THE REJECTION INSIDE THE ORB

● ● ● ● ● MEDIUM RISK

Price pushes toward one side of the ORB, **fakes the breakout**, and reverses hard. When one side fails — the other side becomes the target. There's nothing more bullish than a failed bearish move. Nothing more bearish than a failed bullish move.

- 1 Watch for price probing one side of the ORB**
Price pushes toward the ORH or ORL but doesn't commit. It wicks through and closes back inside the range.
- 2 Confirm the candle closes back inside the ORB**
The candle body must close back inside the range. A wick above with the body still outside is NOT a fake — wait for the close.
- 3 Enter in the opposite direction — target the other ORB level**
Failed bullish = enter short, target ORL. Failed bearish = enter long, target ORH. Your stop sits just beyond the fake breakout extreme.

PAIRS WITH ENTRY 3

A liquidity sweep above the ORH that fails = fake breakout + liquidity sweep. Entries 3 and 4 together = maximum confluence. High conviction.

COMMON MISTAKE

Entering before the candle closes back inside the ORB. Wait for the close — patience separates the profitable traders from the rest.

PROTECT YOUR CAPITAL FIRST.

Every entry model in this playbook is useless if your risk management is broken. **The best traders in the world lose trades — constantly.** What separates them is that their wins are always bigger than their losses, and they never let one bad trade blow up their account.

THE 1% RULE

Never risk more than 1% of your account on a single trade. On a \$50K funded account, that's \$500 max per trade. This keeps you in the game through losing streaks.

MINIMUM 1:2 R:R

Never take a trade unless your target is at least 2x your stop loss distance. A 50% win rate with a 1:2 R:R is still profitable. Most beginners ignore this and wonder why they lose.

- | | |
|---|---|
| ✓ Define your stop before you enter. | Know exactly where you're wrong before you're in the trade. No exceptions. |
| ✓ Move to break even once at 1:1. | When price moves your stop distance in profit, move your stop to entry. You can't lose on the trade now. |
| ✓ Take partial profits at key levels. | If your target is 4R away, consider locking in half at 2R and letting the rest run. |
| ✓ Stop trading after two losses in a day. | Two losses means the market is not playing to your setup today. Step back, protect capital, come back tomorrow. |
| ✓ Never add to a losing trade. | This is the fastest way to blow an account. If your stop hits, the trade is done — move on. |
| ✓ Keep a trade journal. | Log every trade — entry, exit, why you took it, how it played out. Your journal is your most valuable data set. |

The Mental Side: Losing days are part of trading. The goal isn't to avoid losing — it's to manage it. A break-even day is a winning day compared to a blown account. Control what you can control: your entries, your stops, and your position size.

"Consistency isn't about winning every trade. It's about never letting a loss be bigger than your plan allows."

YOUR 7-DAY STARTER PLAN

Reading this is step one. Putting it into practice is where real growth happens. Here's your exact roadmap for the next seven days — follow this and you'll have a working foundation in the ORB strategy by the end of the week.

DAY 1 **Study the ORB foundation.** Re-read pages 2–3 of this guide. Pull up any chart and mark every 15-minute candle at the open for the last 10 sessions. Get your eye trained on identifying the ORH and ORL quickly.

DAY 2 **Backtest Entry 2 (Break & Retest) only.** Go back through the last 20 trading sessions on a 5-min chart. Find every valid setup, mark entry, stop, and target. Record results in a journal.

DAY 3 **Add Entries 3 & 4 to your backtest.** On the same 20 sessions, identify any Liquidity Sweep or ORB Rejection setups. Note how often they appear together as confluence.

DAY 4 **Paper trade live.** Watch the open in real time — no real trades. Call out which entry model is setting up, your entry level, stop, and target. Build your eye for live price action.

DAY 5-6 **Continue paper trading.** Two more sessions of live observation. Focus on Entry 2 only. Master one entry before adding complexity — this is the rule that separates consistent traders from everyone else.

DAY 7 **Review your journal.** Go back through every paper trade from days 4–6. What did you get right? What did you miss? Where did price go after you would have entered? This review is worth more than any course.

After Day 7: If your backtesting shows a consistent edge on Entry 2, you're ready to start trading with small size on a sim account or funded eval. Take it slow — protect the process.

YOU'VE GOT THE PLAYBOOK. NOW EXECUTE.

READY TO GO ALL IN?

This guide gave you the framework. But knowing the entries and actually being able to **execute them consistently under pressure** are two completely different things. That's where 1-on-1 mentorship comes in.

In the Mind Over Markets mentorship program, we work through your specific trades, your specific weaknesses, and build a game plan tailored to you. **Real feedback. Real accountability. Real results.**
