

AAA EAs Builder

AI-native creation, repair, and evidence-first commerce for MT5 and TradingView.

WORKING MVP • AUGUST 2026

Trading automation is powerful—but still difficult to build and trust

Most traders can describe an edge. Far fewer can safely turn it into maintainable code and credible evidence.

01 / ACCESS

Ideas remain trapped in natural language

MQL5 and Pine expertise create a high barrier between strategy intent and executable software.

02 / RELIABILITY

Debugging is slow and fragmented

Prompts, code, compiler errors, revisions, and testing live in separate tools with weak continuity.

03 / TRUST

Performance claims lack context

Metrics without test period, assumptions, drawdown, trade count, and verification status are hard to compare.

PRODUCT OPPORTUNITY

Unify creation, repair, validation, evidence, and distribution in one accountable workflow.

One product turns an idea into inspectable trading software

A single lifecycle keeps intent, source, diagnostics, versions, and evidence connected.

OUTPUTS

MT5 Expert Advisors

MT5 Indicators

Pine Strategies

Pine Indicators

Every result retains an explanation, assumptions, validation state, source hash, workflow snapshot, and revision history.

The customer experience is already product-shaped

The screenshot shows the AAA EAS BUILDER web application. The header includes the logo 'AAA EAS BUILDER' and navigation links for 'Builder', 'Marketplace', and 'How it works'. There are 'Log in' and 'START BUILDING' buttons. The main content area is titled 'AI STRATEGY ENGINEERING FOR MTS AND PINE' and features a large heading 'Build trading systems with AI'. Below this, a paragraph explains the process: 'Describe your edge in plain language. Turn it into structured rules, clear MQL5 or Pine code, and a validation trail you can inspect.' There are two buttons: 'BUILD AN EA +' and 'EXPLORE MARKETPLACE'. At the bottom, there are three tabs: 'MQL5 Expert Advisors', 'PINE Strategies', and 'TRACE Every revision'. The central part of the interface is a 'AI STRATEGY REQUEST' form. It contains a text area with a sample strategy: 'Trend-following system on H1 using EMA 50/200 crossover, ATR-based risk, a time filter, and an ATR trailing stop.' Below the text area are dropdowns for 'MetaTrader 5 - MQL5' and 'H1'. A large orange button says 'GENERATE YOUR EA'. To the right of the form is an 'ILLUSTRATIVE EQUITY CURVE' with a 'DEMO' button. The curve shows a line graph with 'START', 'HYPOTHETICAL', and 'END' markers. Below the form is a 'CONTROLLED WORKFLOW' section with four steps: 'Analyze rules' (completed), 'Generate code' (in progress), 'Review risk' (pending), and 'Compile & validate' (pending).

MetaTrader 5 - MQL5 H1

GENERATE YOUR EA

ILLUSTRATIVE EQUITY CURVE DEMO

START HYPOTHETICAL END

CONTROLLED WORKFLOW

- Analyze rules
- Generate code
- Review risk
- Compile & validate

LIVE LOCAL BUILD

Plain language in

Describe entries, exits, risk, sessions, and filters without writing code first.

Controlled workflow

Specialist agents and deterministic checks expose progress instead of hiding it behind one response.

Inspectable outputs

Users keep the source, version history, diagnostics, and download artifacts.

A controlled agent workflow replaces the one-shot prompt

The MVP uses LangChain for provider/model abstraction and LangGraph for bounded, typed orchestration.

DETERMINISTIC GUARDRAILS

- Typed outputs and versioned prompts
- Pinned workflow snapshot for reproducibility
- Source inspection and forbidden-pattern checks
- Repair loop capped by policy and budget
- Optional allowlisted MetaEditor compilation
- Token and estimated-cost accounting

The copilot closes the loop on real code

The screenshot displays the AAA EAs Builder interface. At the top, there's a header with 'AAA EAS BUILDER' and a navigation bar with tabs for 'EURUSD_Momentum_v3', 'MT5 EXPERT ADVISOR', 'H1', and 'Workflow: EA Builder v2'. Below this, a 'WORKSPACE DIRECTION' box highlights the 'CODE' tab. The main workspace shows a code editor with a file named 'EURUSD_Momentum_v3.mq5'. The code is a MetaTrader 5 Expert Advisor script for a momentum strategy. To the left of the code editor, there's a sidebar with icons for 'Strategy Spec', 'Prompt', 'Code', 'Backtests', and 'Versions'. Below the sidebar, there's a 'COMPARE VERSIONS' button and a 'Model route' section showing 'Primary → Fallback ready'. At the bottom left, a 'VALIDATION' section shows 'Compile passed', '0 errors', '2 warnings', and 'Risk checks passed'. On the right side, an 'AGENT RUN' section shows a vertical progress bar with steps: 'Request Analyst' (COMPLETED), 'Strategy Architect' (COMPLETED), 'Code Generator' (COMPLETED), 'Code Reviewer' (COMPLETED), 'Risk Reviewer' (COMPLETED), 'Compiler' (PASSED), and 'Finalizer' (READY). At the bottom right, there's a 'DOWNLOAD .MQL5' button.

FRESH CONTEXT PER ANSWER

- Project rules + run progress
- Pinned workflow snapshot
- Latest complete source
- Versions + diagnostics
- Compiler output + recent chat

SAFE FIX WORKFLOW

- 1 Copilot proposes a complete file
- 2 Proposal stays tied to its base version
- 3 Apply creates a new immutable version

Trust is a product feature, not a disclaimer

Each state is labeled separately so AI review, static validation, compilation, and backtests are never conflated.

Safety boundary: generated code is downloaded for controlled testing; it is not executed inside the web application.

The marketplace monetizes reusable automation with visible evidence

EVIDENCE BEFORE PURCHASE

- Profit factor, win rate, drawdown, trades
- Test period and modelling assumptions
- Verification state and report lineage
- Equity and drawdown visualization
- Version, compatibility, support, source policy

NEXT COMMERCE MILESTONE

Checkout → order → entitlement
→ protected download

The admin panel is the product's operating system

A private Django Unfold console controls AI supply, workflow policy, product operations, and evidence governance.

AI SUPPLY

- Gateways + encrypted keys
- Provider/model identifiers
- Budgets, priority, health
- Fallback + capabilities

REASONING

- Versioned system prompts
- Agent definitions
- Typed schemas + limits
- Published workflows

OPERATIONS

- Users + projects
- Runs, tokens, cost
- Code versions + diagnostics
- Chat + proposals

COMMERCE

- Products + pricing
- Publishing status
- Test evidence
- Verification labels

Governance by design: write-only secrets • versioned publishing • searchable audit records • existing runs keep pinned configuration

Every generation carries an auditable chain of custody

The system records what was requested, what configuration ran, what code changed, and what evidence supports the result.

WHY INVESTORS SHOULD CARE

Reproducibility

Support & disputes

Quality analytics

Marketplace trust

This lineage becomes the foundation for safer iteration, customer support, model evaluation, and evidence-based merchandising.

Built for an MVP today—and production scale tomorrow

A modular Django core keeps the first release fast to ship while preserving clear upgrade paths.

EXPERIENCE

Django templates • Tailwind • HTMX • Alpine.js

APPLICATION

Class-based views • domain services • permissions • protected downloads

AI ORCHESTRATION

LangChain providers • LangGraph workflow • structured outputs

ASYNC + DATA

Celery • Redis • SQLite development → PostgreSQL production

OPERATIONS

Unfold admin • Docker • Windows BAT • Makefile

Deployment choice

Normal Windows workflow for local teams • Docker web/worker/Redis stack for consistent environments

The current MVP proves the core technical risk

INTERNAL VERIFICATION—NOT CUSTOMER TRACTION

Implemented: authentication, projects, generation, versioned code, diagnostics, copilot proposals, admin AI configuration, catalog, evidence pages, and downloads.

4

artifact types

MT5 EA + indicator, Pine strategy + indicator

5

admin-managed AI agents

Four generation roles plus the project copilot

22

automated tests passing

Accounts, AI config, builder, core, and marketplace

LIVE

Gemini integration verified

A real fix proposal reduced internal diagnostics from 4 to 1

Revenue can combine creation, usage, and commerce

The same platform can monetize both software creation and distribution without depending on a single revenue stream.

SUBSCRIPTION

Builder access

Projects, saved versions, templates, and included monthly generations

USAGE

Advanced AI + validation

Additional generation credits, premium models, compilation, and evidence services

MARKETPLACE

Transaction take rate

Commission on licensed pre-made EAs, indicators, and strategy products

PREMIUM

Vendor and team tools

Higher limits, managed publishing, support, analytics, and governance

Pricing, take rate, and packaging remain to be validated with launch users; no revenue assumptions are presented here.

The path from working MVP to investable launch is clear

NOW

Core workflow proven

- AI generation + repair
- Versioned code + validation
- Admin AI control plane
- Evidence-first catalog

0-3 MONTHS

Production launch

- Checkout + entitlements
- PostgreSQL + observability
- Email/account hardening
- Isolated compile worker

3-6 MONTHS

Evidence engine

- Report ingestion + parsing
- Backtest provenance
- Guided templates
- Initial seller pilot

6-12 MONTHS

Marketplace scale

- Seller onboarding + payouts
- Optimization/forward tests
- Team and vendor tools
- Distribution partnerships

INVESTOR CONVERSATION

Capital accelerates production hardening, evidence infrastructure, payments, and launch distribution.
